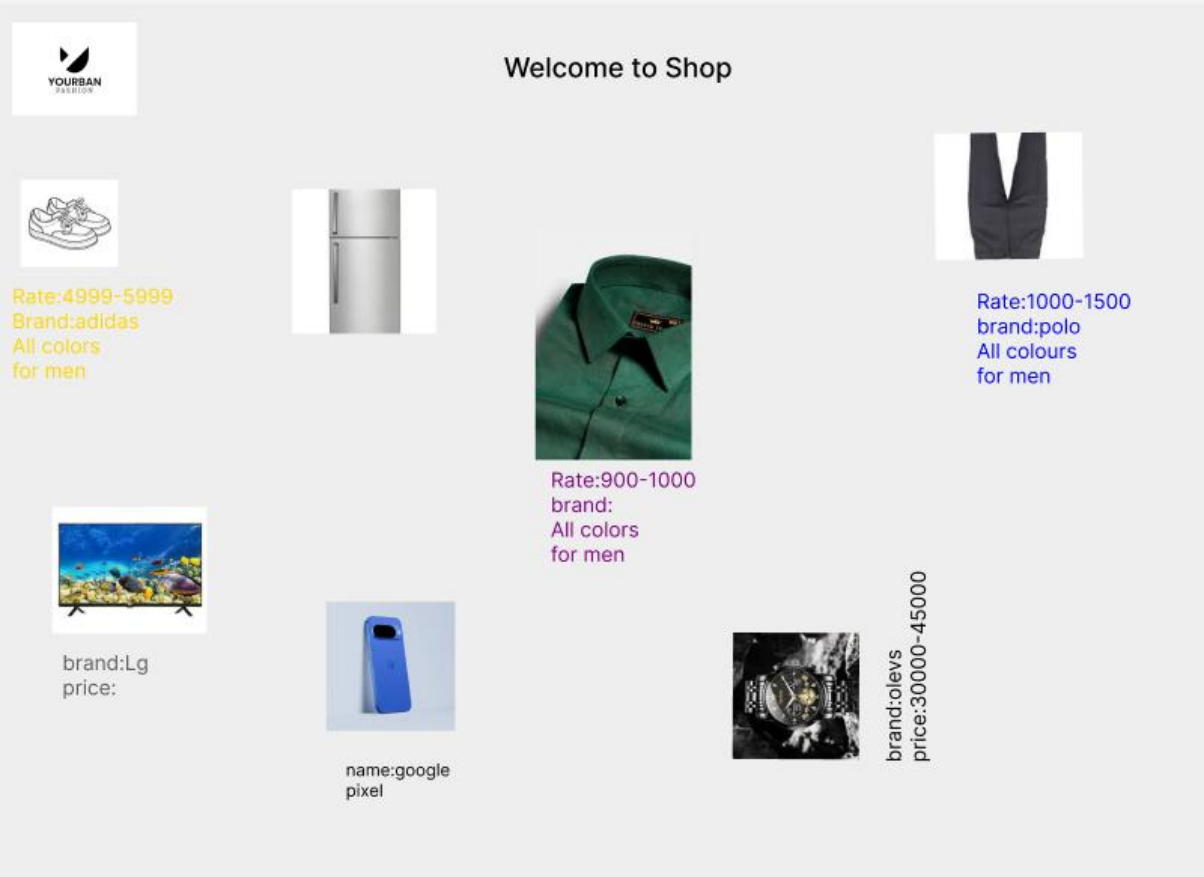
Good vs Bad Design

Bad Design:



Reasons:

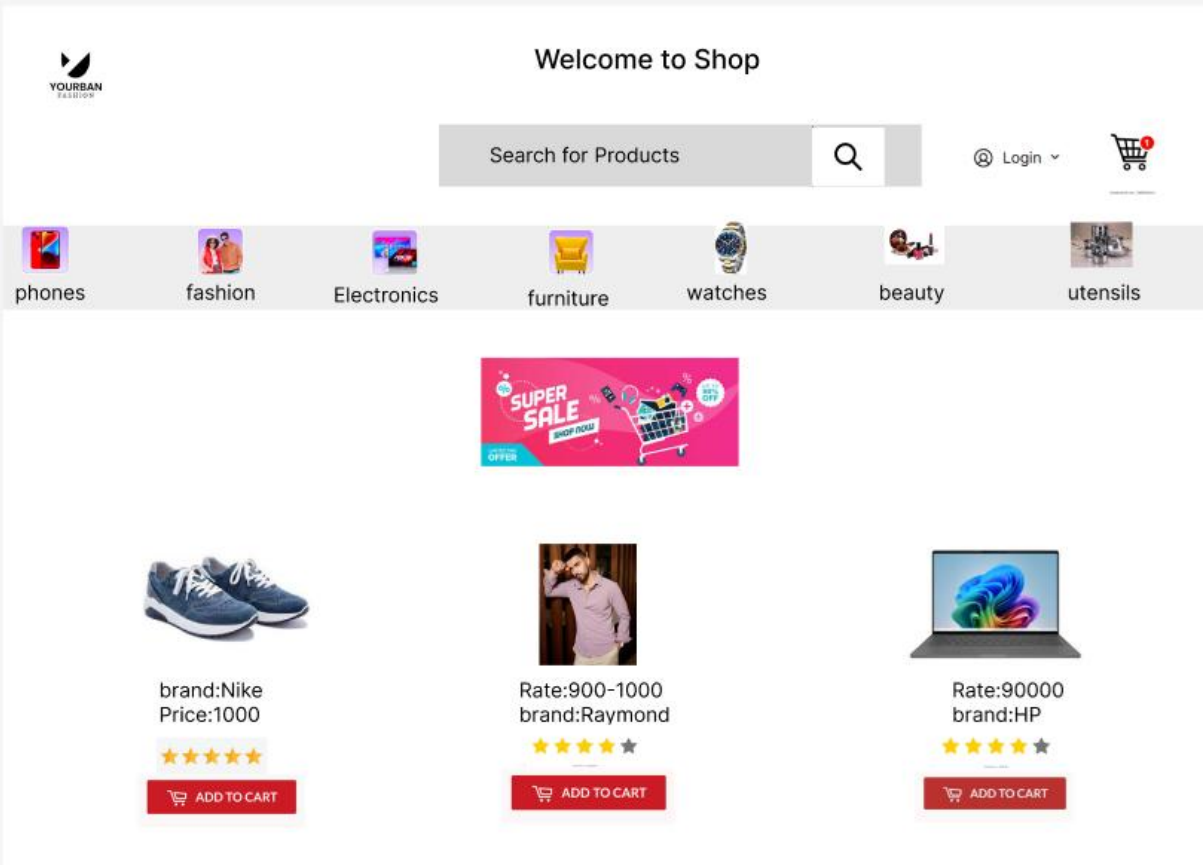
1. Poor Alignment and Layout Structure
Products are randomly placed across the page without a proper grid system. The spacing is uneven, making the design look unorganized and confusing.

2. Inconsistent Text Formatting
Different font colors (yellow, purple, blue, black) and styles are used without consistency. Some product details are aligned vertically, and others horizontally, reducing readability

3. Incomplete and Incorrect Product Information
Some products have missing prices (e.g., LG TV), unclear labels (e.g., “brand:” without value), and inconsistent naming formats like “Rate” and “price”.

4. Weak User Experience and Navigation
There are no filters, search options, categories, or clear navigation system. Users may struggle to browse or compare products easily

Good design:



Reasons:

1. Addition of Navigation and Categories
Category icons (phones, fashion, electronics, etc.) are introduced, making browsing easier. This improves navigation compared to the earlier version which had no clear category system.

2. Improved Layout and Structure
The products are now arranged in a proper grid format with better alignment

and spacing. The page looks more organized and structured compared to the scattered layout in the previous design.

3. Functional Search Bar Added
A centralized search bar is included, allowing users to search for products directly. The previous design lacked any proper search functionality.

4. Product Cards with Call-to-Action Buttons
Each product now includes ratings and an “Add to Cart” button, improving user interaction and making the interface more like a real e-commerce platform.
